genomes

October 5, 2010

`doublingTime` *Doubling time for genome projects*

Description

Calculates the doubling time of genome sequencing project submissions

Usage

```
doublingTime(x, subset, time = "days")
```

Arguments

`x`	genomes data frame with class 'genomes'
`subset`	logical vector indicating rows to keep
`time`	return doubling time in days (default), months, or years

Value

the doubling time

Author(s)

Chris Stubben

Examples

```
data(lproks)
doublingTime(lproks)
doublingTime(lproks, status == 'Complete', time='months')
```

genomes-lines *Add lines to a genomes plot*

Description

Add lines representing the cumulative number of genomes by released date to a genome plot.

Usage

```
## S3 method for class 'genomes':
lines(x, subset,  ...)
```

Arguments

x	genomes data frame with class 'genomes'
subset	logical vector indicating rows to keep
...	additional arguments passed to lines

Details

Use plotby to plot multiple lines within the same genome table. This function adds new lines from different genome tables to the same plot.

Author(s)

Chris Stubben

See Also

plotby

Examples

```
data(lproks)
data(leuks)
data(lenvs)
plot(lproks, log='y', las=1, lty=3)
lines(leuks, col="red", lty=2)
lines(lenvs, col="green3", lty=1)
legend("topleft", c("Microbes", "Eukaryotes", "Metagenomes"),
                  bty='n',   lty=3:1, col=c("blue", "red", "green3"))
```

genomes-plot *Genome table plots by release date*

Description

Generic function for plotting the cumulative number of genomes by released date for genome tables

Usage

```
## S3 method for class 'genomes':
plot(x, subset,
 xlab = "Release Date", ylab ="Genomes",
 type= "l", col = "blue", ...)
```

Arguments

x	a genomes data frame with class 'genomes'
subset	logical vector indicating rows to keep
xlab	x-axis label
ylab	y-axis label
type	type of plot, default is a blue line
col	color
...	additional arguments passed to plot

Value

A plot of the cumulative total of genomes by release date.

Author(s)

Chris Stubben

See Also

plotby to plot release dates by any grouping column

Examples

```
data(lproks)
plot(lproks)
plot(lproks, name %like% 'Yersinia*', ylab="Yersinia genomes")
```

print.genomes *Print genome tables*

Description

Print method for genome tables

Usage

```
  ## S3 method for class 'genomes':
print(x, ...)
```

Arguments

x	a genomes data.frame
...	additional arguments ignored

Details

Prints the first four columns and first five and last row of a genomes data.frame. To view all the columns in a genome table, you can either select fewer than 7 rows or convert the object to a data.frame (`data.frame(lproks)`)

Author(s)

Chris Stubben

Examples

```
data(lproks)
lproks
## full table printed  if 6 rows or less
lproks[1,]
```

genomes-subset *Subset genome tables*

Description

Return subsets of a genome table.

Usage

```
 ## S3 method for class 'genomes':
subset(x, ...)
```

Arguments

x	a genomes data.frame
...	additional arguments ignored

Details

Preserves the genomes class and other attributes if name and released columns are present, otherwise the subsetting operation will return a data.frame. Update methods will not work on subsets of genome tables, but the other genome functions will work

Author(s)

Chris Stubben

Examples

```
data(lproks)
yp<-subset(lproks, name %like% 'Yersinia pest*')
yp
summary(yp)
```

---

genomes-summary *Genome table summaries*

Description

Generic function for summarizing genome tables

Usage

```
## S3 method for class 'genomes':
summary(object, subset, top = 5, ...)
```

Arguments

object	a genomes data frame
subset	logical vector indicating rows to keep
top	number of recently released genomes to display, default is 5
...	additional arguments are currently ignored

Value

A list with 2 or 3 elements: the total number of genomes, counts by status (if column is present), and a table listing recent submissions.

Author(s)

Chris Stubben

See Also

plot.genomes

Examples

```
data(leuks)
summary(leuks)
summary(leuks, group=='Fungi')
```

genomes-update *Genome table updates*

Description

Generic function for updating genome tables.

Usage

```
## S3 method for class 'genomes':
update(object, ...)
```

Arguments

object	a genomes data frame to update
...	additional arguments are currently ignored

Details

update will retrieve the new genome table using the update string in attr(object, 'update'). The new table will replace the existing version, *but not permanently*, since reloading the dataset using data will restore the older version.

Value

Returns the updated genome table and a count of the number of new IDs added and old IDs removed. Old IDs are typically assembly genomes in NCBI tables that have been released as a single complete genome.

Author(s)

Chris Stubben

See Also

genomes-summary, genomes-plot

Examples

```
## Not run: data(lproks)
## Not run: update(lproks)

# to replace the data set permanently
x <- system.file("data", "lproks.rda", package="genomes")
x
## Not run: save(lproks, file=x)
```

genomes *Introduction to the genomes package*

Description

Genomes sequencing project statistics from prokaryotes, eukaryotes, and metagenomes.

Author(s)

Chris Stubben <stubben@lanl.gov>

Examples

```
data(lproks)
lproks
summary(lproks)
plot(lproks)
## Not run: update(lproks)
```

genus *Extract the genus name*

Description

Extracts the genus name from a scientific name (latin binomial)

Usage

```
genus(x)
```

Arguments

x	A vector of scientific names

Details

Returns the first word in the scientific name. For candidate species labeled *Candidatus*, then the second word is returned.

Value

A vector of genus names

Author(s)

Chris Stubben

See Also

species

Examples

```
genus("Bacillus anthracis Ames")
data(lproks)
x <- table2(genus(lproks$name))[1:10,]
dotplot(rev(x), xlab="Genomes")
```

`gold` *Genomes OnLine Database (GOLD) table*

Description

Genome sequencing projects listed at GOLD

Usage

```
data(gold)
```

Format

A genomes data frame with 7000+ observations on the following 105 variables.

`goldstamp` GOLD project id

`name` project name (was ORGANISM NAME)

`status` status (was SEQUENCING STATUS)

`released` released date (was COMPLETION DATE)

`superkingdom` a character vector

`phylum` a character vector

`class` a character vector

`order` a character vector

`family` a character vector

`genus` a character vector

`species` a character vector

`domain` a character vector

`strain` a character vector

`serovar.biovar` a character vector

`common.name` a character vector

`project.name` a character vector

`culture.collection` a character vector

`type.strain` a character vector

`old.goldstamp` a character vector

`project.type` a character vector

`project.status` a character vector

`availability` a character vector

`sequencing.centers` a character vector

`funding` a character vector
`contact.name` a character vector
`contact.email` a character vector
`contact.url` a character vector
`locus.tag` a character vector
`publication` a character vector
`project.relevance` a character vector
`taxon.id` a numeric vector
`project.id` a numeric vector
`archive.id` a numeric vector
`short.reads.archive.id` a character vector
`gcat_id` a character vector
`hmp.id` a numeric vector
`homd.id` a character vector
`straininfo.id` a numeric vector
`greengenes.object.id` a character vector
`img.object.id` a numeric vector
`genome.data` a character vector
`sequencing.quality` a character vector
`comments` a character vector
`library.method` a character vector
`reads.count` a character vector
`vector` a character vector
`assembly.method` a character vector
`sequencing.depth` a character vector
`gene.calling.method` a character vector
`contig.count` a numeric vector
`size.kb` a numeric vector
`orfs` a numeric vector
`chromosome.count` a numeric vector
`plasmid.count` a numeric vector
`gc.content` a numeric vector
`sequencing.method` a character vector
`sequencing.country` a character vector
`isolation.site` a character vector
`isolation.source` a character vector
`isolation.comments` a character vector
`collection.date` a character vector
`isolation.country` a character vector
`isolation.pubmed.id` a numeric vector

`geographic.location` a character vector
`latitude` a character vector
`longitude` a character vector
`altitude` a character vector
`depth` a character vector
`host.name` a character vector
`host.taxon.id` a numeric vector
`host.gender` a character vector
`host.age` a character vector
`host.race` a character vector
`host.health` a character vector
`host.medication` a character vector
`host.specificity` a logical vector
`body.sample.site` a character vector
`body.product` a character vector
`body.sample.subsite` a character vector
`host.comments` a character vector
`oxygen.requirement` a character vector
`cell.shape` a character vector
`sporulation` a character vector
`pressure` a character vector
`temperature.range` a character vector
`salinity` a character vector
`ph` a character vector
`cell.diameter` a character vector
`cell.length` a character vector
`color` a character vector
`gram.staining` a character vector
`biotic.relationships` a character vector
`symbiotic.interaction` a character vector
`symbiotic.relationship` a character vector
`symbiont.name` a character vector
`symbiont.taxon.id` a numeric vector
`cell.arrangement` a character vector
`disease` a character vector
`habitat` a character vector
`temperature` a character vector
`metabolism` a character vector
`motility` a character vector
`phenotype` a character vector
`energy.source` a character vector

Details

The column names match the postions and names in the source file except for the first four columns. Note that released dates are listed for complete genomes only.

References

http://nar.oxfordjournals.org/cgi/content/full/gkp848v1

Examples

```
data(gold)
gold
# single row, long format
t(gold[1,])
## release date is completion date
table(!is.na(gold$released), gold$status)
## genomes with Entrez project ID
table(!is.na(gold$project.id), !is.na(gold$released),
      dnn=list("Has project ID?", "Is complete?"))
plotby(gold, "project.type", log='y')
table2(gold$project.type)
plotby(gold, "domain", project.type == 'Genome-Isolate', log='y')
```

---

hmp *Human Microbiome Project (HMP) data*

Description

Genome sequencing projects listed by the Human microbiome project

Usage

```
data(hmp)
```

Format

A genomes data frame with 18 columns.

`pid` HMP project ID

`name` project name

`status` project status

`released` date draft sequencing completed

`entrezid` Entrez genome project id

`taxid` NCBI taxonomy id

`phylum` phylum

`site` primary body sample site

`subsite` body sample subsite

`goal` finishing goal

`submission` NCBI submission status

`center` sequencing center name

`assembler` assembler

`reads` total number of reads

`coverage` coverage

`contigs` number of contigs

`platform` sequencing platform

`comment` comments

Details

see the HMP Project Catalog at http://www.hmpdacc.org/ . The full table has 34 columns and only 18 columns are displayed in this dataset

Source

http://durian.jgi-psf.org/~kliolios/HMP/hmp.xls

Examples

```
data(hmp)
hmp
 t(hmp[1,])
summary(hmp)
plotby(hmp, "site", main='Human microbiome project', lbty='n', log='y', lcex=.7)
plotby(hmp)
table(hmp$status, !is.na(hmp$released),
dnn=list("status", "released?"))
```

---

lenvs *Metagenome sequencing projects at NCBI*

Description

Metagenome sequencing projects from the Entrez genome project at NCBI

Usage

```
data(lenvs)
```

Format

A genomes data frame with observations on the following 10 variables.

`pid` genome project id

`name` metagenome title or taxonomy name

`released` released date

`source` metagenome source

`type` metagenome type, environmental (E) or organismal (O)

`accession` comma-separated list of accession numbers

`parent` parent genome project id

`center` sequencing center

`blast` has blast page

`traces` has traces

Source

downloaded from http://www.ncbi.nlm.nih.gov/genomes/lenvs.cgi

Examples

```
data(lenvs)
lenvs
## single row
t(lenvs[1,])
plot(lenvs)
summary(lenvs)
```

---

leuks *Eukaryotic genome projects at NCBI*

Description

Eukaryotic genome sequencing projects at NCBI

Usage

```
data(leuks)
```

Format

A genomes data frame with observations on the following 20 variables.

`pid` genome project id

`name` taxonomy name

`status` sequencing status

`released` released date

`group` taxonomy group (animals, fungi, protists, or plants)

`subgroup` taxonomy subgroup

`taxid` taxonomy id

`size` genome size (Mbp)

`chromosomes` number of chromosomes

`method` sequencing method

`depth` depth or coverage

`center` pipe-separated list of sequencing centers

`genbank` has GenBank sequences

`pubmed` has PubMed

`refseq` has RefSeq sequences

`gene` has Gene link

`traces` has Traces

`blast` has Blast page

`mapview` has MapView

`ftp` comma-separated list of ftps

Source

downloaded from Entrez genome project at http://www.ncbi.nlm.nih.gov/genomes/leuks.cgi

Examples

```
data(leuks)
leuks
# single row, long format
t(leuks[1,])
plot(leuks)
summary(leuks)
dotplot(sort(table(leuks$subgroup)), pch=16, xlab="Genome projects")
```

---

like *Pattern matching using wildcards*

Description

Pattern matching using wildcards

Usage

```
x %like% pattern
```

Arguments

`pattern`	character string containing the pattern to be matched
`x`	values to be matched

Details

Only wildcards matching a single character '?' or zero or more characters '*' are allowed. Matches are case-insensitive. The pattern is first converted to a regular expression using `glob2rx` then matched to values in `x` using `grep`.

This is a shortcut for a commonly used expression found in the `subset` example where `nm %in% grep("^M", nm, value=TRUE)` simplifies to `nm %like% 'M*'`.

Value

A logical vector indicating if there is a match or not. This will mostly be useful in conjunction with the `subset` function.

Author(s)

Chris Stubben

See Also

`grep`, `glob2rx`, `subset`

Examples

```
data(lproks)
subset(lproks, name %like% 'Yersinia*', c(name, released))
# also works with date or numeric fields
subset(lproks, released %like% '2008-01*', c(name, released))
```

---

lproks *Microbial genome projects at NCBI*

Description

Microbial genomes from Entrez genome project at NCBI.

Usage

```
data(lproks)
```

Format

A genomes data frame with observations on the following 31 variables.

`pid` genome project id

`name` taxonomy name

`status` sequencing status, Complete, Assemby, or In Progress genomes

`released` released date, complete and WGS genomes only

`taxid` taxonomy id

`kingdom` kingdom

`group` phylum or class

`size` genome size (Mbp)

`GC` percent GC content

`chromosomes` number of chromosomes, complete genomes only

`plasmids` number of plasmids, complete genomes only

`modified` modified date, complete genomes only

`genbank` comma-separated list of GenBank accession numbers

`refseq` comma-separated list of RefSeq accession numbers

`publication` comma-separated list of PubMed ids, complete genomes only

`center` pipe-separated list of sequencing centers

`contigs` number of genome contigs. For complete genomes, contigs are the sum of chromosomes and plasmids

`cds` number of coding sequences, WGS only

`url` sequencing center url, WGS and In Progress genomes only

`gram` gram stain

`shape` shape

`arrange` arrangement

`endospore` endospores

`motility` motility

`salinity` salinity

`oxygen` oxygen requirement

`habitat` habitat

`temp` temperature preference

`range` temperature range

`pathogen` pathogenic in host

`disease` disease

Details

This table is constructed using all three tabs at `http://www.ncbi.nlm.nih.gov/genomes/lproks.cgi`. Complete genomes and In Progress tabs are combined and then joined to the Organism Info tab.

Nearly all of the Assembly genomes released after Sept 2009 are missing release dates. If needed, these dates are available from Entrez Genomes (see the example in `wgs`).

The `update(genomes)` function downloads a recent copy of the table from NCBI. The number of new project IDs are reported as well as the number of project IDs removed (which are typically Assembly genomes that are now available as a Complete sequence). Please note that NCBI is currently changing how prokaryotic genomes are managed and some changes to these tables are possible (see `http://www.ncbi.nlm.nih.gov/genomeprj` for details).

Source

downloaded from `http://www.ncbi.nlm.nih.gov/genomes/lproks.cgi`

Examples

```
data(lproks)
lproks
#single row (long format)
t(lproks[1,])
class(lproks)
## download stats
attributes(lproks)[c("stats", "date","url")]
summary(lproks)
## many Assembly genomes are now missing release dates
table2(!is.na(lproks$released), lproks$status, dnn=list("Released Date?", "Status"))
plot(lproks)
plotby(lproks, log='y', las=1)
## download recent table from NCBI
## Not run: update(lproks)
## Yersinia genomes
yp <- subset(lproks, name %like% 'Yersinia*')
yp
summary(yp)
plotby(yp, labels=TRUE, cex=.5, lbty='n')
```

`plotby` *Plot groups of genomes by release date*

Description

Plots the cumulative number of genomes by released date for different groups of genomes

Usage

```
plotby(x, groupby = "status", subset = NA, top = 5,
labels = FALSE, abbrev = TRUE, flip = NA,
 legend = "topleft", lbty = "o", lcol = 1, ltitle = NULL, lcex = 1,
 lsort = TRUE, cex = 1, ylim = NA, las = 1, lwd = 1, log = "",
xlab = "Release Date", ylab = "Genomes", type='l',
col = c("blue", "red", "green3", "magenta", "yellow"),
lty = 1:top, pch = c(15:18, 1:3), ...)
```

Arguments

`x`	a genomes data frame
`groupby`	a column name in the genomes table or a vector to group by
`subset`	logical vector indicating rows to keep
`top`	number of top groups to display
`labels`	add genome names to each point - plot a single line and
`abbrev`	abbreviated genome names
`flip`	a number indicating where to flip labels from right to left, default is middle of plot
`legend`	a legend keyword or vector of x,y coordinates, defaults to top-left corner. Use NA for no legend

lbty	legend box type
lcol	number of columns in legend
ltitle	legend title
lcex	legend size expansion
lsort	sort legend by decreasing order of genomes, default true
cex	label size expansion
ylim	y axis limits
las	rotate axis labels
lwd	line width
log	log scale
xlab	x axis label
ylab	y axis label
type	plot type
col	line or point colors
lty	line type
pch	point type
...	additional items passed to plot

Details

Two different plot types are available. The default is to plot multiple lines, one for each group (like matplot). If `labels=TRUE`, then a single line is drawn with different labeled points for each group.

Value

A plot of released dates by group

Author(s)

Chris Stubben

See Also

`plot.genomes`

Examples

```
data(lproks)
# default group is status
plotby(lproks)
plotby(lproks, 'habitat', top=3)

## groupby can be a vector
plotby(lproks, genus(lproks$name), log='y', lcex=.7)
plotby(lproks, factor(lproks$pathogen %in% c("No"),
   labels=c("Pathogen", "Non-pathogen")), pathogen!="")

# OR plot labels
plotby(lproks, subset=name %like% 'Yersinia pestis*', labels=TRUE, cex=.5, lbty='n')
```

`species` *Extract the species name*

Description

Extracts the species name from a scientific name

Usage

```
species(x, abbrev=FALSE, epithet=FALSE)
```

Arguments

`x`	A vector of scientific names
`abbrev`	Abbreviate the genus name
`epithet`	Return only the specific epithet (default is genus + specific epithat)

Details

Returns the species name. For candidate species labeled *Candidatus*, the qualifier is not included

Value

A vector of species names

Author(s)

Chris Stubben

See Also

`genus`

Examples

```
species("Bacillus anthracis Ames")
species("Bacillus anthracis Ames", abbrev=TRUE)
species("Bacillus anthracis Ames", epithet=TRUE)
data(lproks)
x <- table2(species(lproks$name))[1:10,]
dotplot(rev(x), xlab="Genomes")
## abbreviate genus name
x <- subset(lproks, name %like% 'Bacillus*')
x <- table2(species(x$name))[1:10, ]
names(x) <- species(names(x), TRUE)
dotplot(rev(x), xlab=expression(italic(Bacillus) ~ genomes))
```

table2 *Format and sort a contigency table*

Description

Formats the output of table into an matrix ordered by total counts in descending order

Usage

```
table2(..., n = 10)
```

Arguments

...	one or more objects passed to table
n	number of rows to display, default 10

Details

Currently limited to 1 or 2 dimensional table arrays.

Value

A matrix, sorted by total counts in descending order. Any rows or columns with zero counts are also removed from the matrix.

Author(s)

Chris Stubben

See Also

table

Examples

```
data(leuks)
table(leuks$subgroup)
table2(leuks$subgroup)
## to display all rows, use NA or a large number...
table2(leuks$subgroup, n=100)
# 2-d table
table2(leuks$group, format(leuks$released, "%Y"))
```

taxid2names *Retreive taxonomy names from NCBI*

Description

Search the Entrez taxonomy database at NCBI and return names and lineages for valid taxonomy ids

Usage

```
taxid2names(ids)
```

Arguments

ids	an NCBI taxonomy id

Details

The function searches the Taxonomy database using the EFetch utility and returns an XML summary report, and then parses the name and lineage fields

Value

A dataframe listing taxonomy id, name and lineage

Author(s)

Chris Stubben

Examples

```
taxid2names(2)
x <- taxid2names(c(280855, 11595, 273349))
# remove common parents
x$lineage<- gsub("Viruses; ssRNA viruses; ssRNA negative-strand viruses; Bunyaviridae; ",
x
```

term2neighbor *Retrieve genome neighbors from NCBI*

Description

Search Entrez Genome at NCBI and retrieve links (other genomes for species) to the nucleotide database using Entrez programming utilities (eUtils)

Usage

```
term2neighbor(term, derived = FALSE, sortdate = FALSE, fulltable = FALSE)
```

Arguments

term	Any valid combination of Entrez search terms
derived	Include GenBank sequences that the Reference sequences were derived from (default is only the neighbors in genome_nuccore_samespecies)
sortdate	Sort the results by released date (default is by name)
fulltable	Return all 12 summary fields

Details

The functions searches the Genome database using the ESearch utility, finds links to Other Genomes for Species using ELink, returns document summary pages using ESummary, and then parses the XML fields using the XML package

Value

A genomes data frame with 5 columns (acc, name (defline), released date, taxid, and size). If fulltable is TRUE, then all fields are returned

Note

This function will most likely be useful for viral sequences, which typically have only one reference sequence per species, and other strains are linked as Genome Neighbors.

Author(s)

Chris Stubben

References

A description of the Entrez programming utilities is at http://eutils.ncbi.nlm.nih.gov/.

See Also

term2summary and virus

Examples

```
data(virus)
## Nipah virus list 7 neighbors
subset(virus, name %like% 'Nipah*')
# term2neighbor('Nipah virus[orgn]')
#  if plotting, also  include the genbank sequence that reference was derived from
x <- term2neighbor('Nipah virus[ORGN]', derived = TRUE)
x
plot(x, ylab = 'Nipah virus sequences')
```

`term2summary` *Retrieve genome summaries from NCBI*

Description

Search the Entrez Genome Project or Genome database at NCBI and retrieve a summary table using Entrez programming utilities (eUtils)

Usage

```
term2summary(term, db = 'genomeprj', sortdate = FALSE, fulltable = FALSE)
```

Arguments

`term`	Any valid combination of Entrez search terms
`db`	Database to search, either genomeprj or genome
`sortdate`	Sort the results by status and released date (default is by name)
`fulltable`	Return all 20 E-summary fields for genomeprj or 12 fields for genome.

Details

Searches either genome database using the ESearch utility, returns document summary pages using the ESummary utility, and then parses the XML fields using the `XML` package.

If searching Genome Project, then a genomes data frame with 4 columns (project id, name, status, released date) is returned. If fulltable is TRUE, then all 20 fields are returned, plus extra rows for overview genome projects (type = Top level), RefSeq genomes (type = RefSeq), and plasmid genomes (type = Plasmid genome). In many cases, recent assemblies will be listed on an overview page, a genome page (missing released date), and a RefSeq page (missing status).

If searching Genomes, then a genomes data frame with 6 columns (acc, name (defline), status, released, taxid, size) is returned, or all 12 columns if fulltable is TRUE.

Value

A genomes data frame

Author(s)

Chris Stubben

References

A description of the Entrez programming utilities is at http://eutils.ncbi.nlm.nih.gov/.

`term2neighbor`

Examples

```
# Genomes sequenced at Los Alamos
x <- term2summary( "Los Alamos AND Bacteria[ORGN]")
x
summary(x)
#  list of centers in lproks table are often incomplete
data(lproks)
summary(lproks, center %like% '*Los Alamos*')

##In progress microbial genomes with data in the Short Read Archive
x <- term2summary( 'inprogress[Sequencing status] AND genomeprj sra[Filter] NOT eukaryota
x

## Taxonomy queries like genomes in Bacteroidetes phylum
x <- term2summary("Bacteroidetes[ORGN]")
x
plot(x, ylab = 'Bacteroidetes genomes')
```

---

top *Find the most common values*

Description

Finds the most common values in a vector with repeating elements.

Usage

```
top(x, n = 10)
```

Arguments

x	A vector with some repeating elements
n	The number of top elements

Details

`top` returns a logical vector indicating if the element is one of the most common values in the vector

Value

A logical vector indicating if the element is one of the top values.

Note

This will mostly be useful in conjunction with the `subset` function.

```
x <- c("a", "b", "b", "c")
top(x, 1)
#top is a short cut for
x %in% names(sort( table(x), decreasing=TRUE))[1]

data(lproks)
x <- subset(lproks, status != 'In Progress' , c(name, status, released))
# get top 15 genera
x <- subset(x, top(genus(name), 15))
x$status[x$status == 'Assembly'] <- 'WGS'
y <- table(genus(x$name), x$status)
y <- cbind(y, Total=rowSums(y))
y <- y[order(y[ ,3]), ]    # order by total

dotplot(y ,  xlab=list("Number of genomes at NCBI",cex=.8),
        par.settings=list(superpose.symbol=list(pch=15:17)),
        auto.key=list(cex=.8, columns=3, between=.5,  between.columns=1))
```

---

virus *Virus genomes at NCBI*

Description

Viral reference genome sequencing projects at NCBI.

Usage

```
data(virus)
```

Format

A genomes data frame with the following 8 variables.

`name` virus name

`released` release date

`neighbors` number of Genome Neighbors

`segments` number of segments

`refseq` RefSeq accession number

`isolate` isolate name

`size` genome size (nt)

`proteins` number of proteins

Details

Please refer to the Viral genomes page at NCBI http://www.ncbi.nlm.nih.gov/genomes/GenomesHome.cgi?taxid=10239&hopt=aboutsite for details on Reference genomes. One Reference genome is selected per viral species and other strains are linked as Genome Neighbors (other complete sequences for the species). See the term2neighbor function to get a list of Genome neighbors.

Summing the number of segments in this table should return the total number of reference sequences; however, summing the number of genome neighbors will not return the number of linked GenBank sequences since many counts are duplicated or missing (eg, Dengue virus neighbors are listed 4 times, Influenza A and B neighbors are missing.

Source

downloaded from http://www.ncbi.nlm.nih.gov/genomes/GenomesGroup.cgi?taxid=10239&opt=Virus&sort=genome

Examples

```
data(virus)
plot(virus)
summary(virus)
sum(virus$segments)
# some neighbors repeat (others are missing)
subset(virus, name %like% 'Dengue*')
subset(virus, name %like% 'Monkey*')
# list the neighbors
term2neighbor("Monkeypox virus[orgn]")

## most common phages
table2(species(grep("phage", virus$name, value=TRUE)))
```

---

wgs *Bacterial assembly sequences*

Description

Bacterial whole genome shotgun (wgs) assemblies in the Entrez Genome database

Usage

```
data(wgs)
```

Format

A genomes data frame with 1000+ observations on the following 9 variables.

`acc` accession number without trailing 00000000

`name` taxonomy name

`status` status, always Assembly

`released` release date

`size` size (bp)

`proteins` proteins

`rna` RNA

`genes` genes

`updated` update date

Details

See the left side bar at the Genomes home page at http://www.ncbi.nlm.nih.gov/sites/entrez?db=genome

Source

http://www.ncbi.nlm.nih.gov/genomes/genlist.cgi?taxid=2&type=3

Examples

```
data(wgs)
wgs
summary(wgs)[[1]]
data(lproks)
## missing dates in genome project - paste 8 zeros to acc and match to refseq without dat
x <- subset(wgs, paste( wgs$acc, "00000000", sep="")  %in% lproks$refseq[is.na(lproks$rel
         c(name, released, status))
x
table(format(x$released, "%Y-%m"))
## better plot than
## plotby(lproks, lsort=FALSE)
plotby(rbind(x, lproks[,c("name", "released", "status")]), log='y')
```
