ChromosomeArmModels-class

*Class "ChromosomeArmModels", for dependency models in chromosomal arm*

---

## Description

Collection of dependency models fitting two data sets in particular chromosome arm.

## Objects from the Class

Function `screen.cgh.mrna` and `screen.cgh.mir` returns an object of this class.

## Slots

**models** a list of [DependencyModels](#)

**chromosome** factor of chromosome

**arm** factor of arm of the chromosome

**method** a string with name of the method used in dependency models

**params** a list of parameters of the method

**windowSize** number of genes in dependency models windows

## Methods

`[[ signature(x = "ChromosomeArmModels")`: Returns the a model from the list

`[[<- signature(x = "ChromosomeArmModels")`: Attaches the a model to the list

**getModelMethod** `signature(model = "ChromosomeArmModels")`: Returns the name of the used method

**getParams** `signature(model = "ChromosomeArmModels")`: Returns a list of used parameters for the method

**getModelNumbers** `signature(model = "ChromosomeArmModels")`: Returns the number of the dependency models

**getLoc** `signature(model = "ChromosomeArmModels")`: Returns a vector of gene locations in the dependency models

**getGeneName** `signature(model = "ChromosomeArmModels")`: Returns a vector of gene names in the dependency models

**getScore** signature(model = "ChromosomeArmModels"): Returns a vector of dependency scores of the dependency models

**getChromosome** signature(model = "ChromosomeArmModels"): Returns the chromosome

**getArm** signature(model = "ChromosomeArmModels"): Returns the arm of the chromosome

**getWindowSize** signature(model = "ChromosomeArmModels"): Returns the size of the window used in the dependency models.

**topGenes** signature(model = "ChromosomeArmModels", num = "numeric"): Returns a vector of given number of names of the genes which have the highest dependency score

**topModels** signature(model = "ChromosomeArmModels", num = "numeric"): Returns a list with given number of dependency models which have the highest dependency score

**isEmpty** signature(model = "ChromosomeArmModels"): Returns TRUE if model has no dependency models

**orderGenes** signature(model = "ChromosomeArmModels"): Returns a data frame with gene names and their model scores sorted

**findModel** signature(model = "ChromosomeArmModels"): Finds a dependency model by gene name and returns it.

#### Author(s)

Olli-Pekka Huovilainen <ohuovila@gmail.com>

#### See Also

To calculate dependency models for chromosomal arm: [screen.cgh.mrna](#). This class holds a number of [DependencyModels](#). To plot dependency scores see [dependency score plotting](#). Dependency models for whole chromosomal arm: [ChromosomeModels](#). Dependency models for whole genome: [GenomeModels](#).

#### Examples

```
data(chromosome17)

## Calculation of dependency models for chromosomal arm
modell17p <- screen.cgh.mrna(geneExp, geneCopyNum, windowSize = 10, chr
= 17, arm = 'p')

modell17p

## Information of the dependency model which has the highest dependency score
topGenes(modell17p, 1)

## Finding a dependency model by its name
findModel(modell17p, "ENSG00000129250")

## Information of the first dependency model
modell17p[[1]]

#Plotting
plot(modell17p)
```

---

ChromosomeModels-class  
*Class "ChromosomeModels"*

---

### Description

Collection of dependency models fitting two data sets in particular chromosome. The dependency models are in two [ChromosomeArmModels](#) objects which represents q and p arms.

### Objects from the Class

Function [screen.cgh.mrna](#) and [screen.cgh.mir](#) returns an object of this class.

### Slots

**pArmModels, qArmModels** an [ChromosomeArmModels](#) object, dependency models in p or q arm  
**chromosome** a factor of chromosome  
**method** a string with name of the method used in dependency models  
**params** a list of parameters of the used method

### Methods

**getChromosome** signature(model = "ChromosomeModels"): Returns the chromosome  
**getPArm** signature(model = "ChromosomeModels"): Returns the dependency models of the p arm which is of class [ChromosomeArmModels](#)  
**getQArm** signature(model = "ChromosomeModels"): Returns the dependency models of the q arm which is of class [ChromosomeArmModels](#)  
**getModelMethod** signature(model = "ChromosomeModels"): Returns the name of the used method  
**getParams** signature(model = "ChromosomeModels"): Returns a list of used parameters for the method  
**getChr** signature(model = "ChromosomeModels"): Returns the chromosome  
**getWindowSize** signature(model = "ChromosomeModels"): Returns the size of the window used in the dependency models.  
**topGenes** signature(model = "ChromosomeModels", num = "numeric"): Returns a vector of given number of names of the genes which have the highest dependency score  
**topModels** signature(model = "ChromosomeModels", num = "numeric"): Returns a list with given number of dependency models which have the highest dependency score  
**isEmpty** signature(model = "ChromosomeModels"): Returns TRUE if model has no dependency models  
**orderGenes** signature(model = "ChromosomeModels"): Returns a data frame with gene names and their model scores sorted  
**findModel** signature(model = "ChromosomeArmModels"): Finds a dependency model by gene name and returns it.

**Author(s)**

Olli-Pekka Huovilainen <ohuovila@gmail.com>

For calculation of dependency models for chromosomal arm: [screen.cgh.mrna](#). This class holds a number of [DependencyModel](#) in two [ChromosomeArmModels](#) objects. For plotting dependency scores see [dependency score plotting](#). Dependency models for whole genome: [GenomeModels](#).

**Examples**

```
data(chromosome17)

## calculate dependency models over chromosome 17
modell17 <- screen.cgh.mrna(geneExp, geneCopyNum, windowSize = 10, chr
= 17)

modell17

# genes in p arm with the highest dependency scores
topGenes(getPArm(modell17), 5)

plot(modell17)
```

---

DependencyModel-class

*Class "DependencyModel"*

---

**Description**

A Dependency model for one or two data sets

**Objects from the Class**

Returned by [fit.dependency.model](#), [ppca](#), [pfa](#), [pcca](#) and [pcca.isotropic](#) functions.

**Slots**

**W** a list of X, Y and total components containing the relationship between two data sets; for dependency model for one dataset, only total is given

**phi** a list of X, Y and total components containing the data set specific covariances; for dependency model for one dataset, only total is given

**score** score for fitness of model

**loc** middle location of the window in base pairs

**geneName** name of the gene in the middle of the window

**windowSize** size of the window

**method** name of the used method

**params** list of parameters used in dependency model

**chromosome** Chromosome where the dependency model is calculated

**arm** Chromosome arm where the dependency model is calculated

**Methods**

**setLoc**<- signature(model = "DependencyModel"): sets models location

**setGeneName**<- signature(model = "DependencyModel"): sets models gene name

**setChromosome**<- signature(model = "DependencyModel"): sets models chromosome

**setArm**<- signature(model = "DependencyModel"): sets models chromosome arm

**getW** signature(model = "DependencyModel"): Returns a list of model variable  $W_s$   $X$ ,  $Y$  and total component

**getPhi** signature(model = "DependencyModel"): Returns a list of model variable  $\phi_{is}$   $X$  and  $Y$  and total component

**getScore** signature(model = "DependencyModel"): Returns the dependency score of model

**getLoc** signature(model = "DependencyModel"): Returns the middle location of the window

**getGeneName** signature(model = "DependencyModel"): Returns the name of the gene in the middle of window

**getChromosome** signature(model = "DependencyModel"): Returns the chromosome

**getArm** signature(model = "DependencyModel"): Returns the chromosome arm

**getParams** signature(model = "DependencyModel"): Returns a list of used parameters for the method

**getModelMethod** signature(model = "DependencyModel"): Returns the name of the used method

**getWindowSize** signature(model = "DependencyModel"): Returns the size of window

**Author(s)**

Olli-Pekka Huovilainen <ohuovila@gmail.com>

**Examples**

```
data(chromosome17)
window <- fixed.window(geneExp, geneCopyNum, 10, 10)
model <- fit.dependency.model(window$X, window$Y)
model

# Contributions of samples and variables to model
plot(model, geneExp, geneCopyNum)
```

---

GenomeModels-class *Class "GenomeModels"*

---

### Description

Collection of dependency models fitting two data sets in whole genome. The dependency models are in a list of [ChromosomeModels](#)s (which represents each chromosome) that have two [ChromosomeArmModels](#) objects (which represents q and p arms) that have a list of dependency models in that chromosomal arm.

### Objects from the Class

Function `screen.cgh.mrna` and `screen.cgh.mir` returns an object of this class.

### Slots

**chromosomeModels** a list of [ChromosomeModels](#) of all chromosomes

**method** a string with name of the method used in dependency model

**params** a list of parameters of the method

### Methods

**[[] signature** (`x = "GenomeModels"`): Returns a [ChromosomeModels](#) from the list. X and Y chromosomes can be accessed with 23 and 24 or 'X' and 'Y'

**[[<- signature** (`x = "GenomeModels"`): Attaches a [ChromosomeModels](#) to the list. X and Y chromosomes can be accessed with 23 and 24 or 'X' and 'Y'

**getModelMethod** signature (`model = "GenomeModels"`): Returns the name of the used method

**getParams** signature (`model = "GenomeModels"`): Returns a list of used parameters for the method

**getChr** signature (`model = "GenomeModels"`): Returns the chromosome

**getWindowSize** signature (`model = "GenomeModels"`): Returns the size of the window used in the dependency models.

**topGenes** signature (`model = "GenomeModels", num = "numeric"`): Returns a vector of given number of names of the genes which have the highest dependency score

**topModels** signature (`model = "GenomeModels", num = "numeric"`): Returns a list with given number of dependency models which have the highest dependency score

**orderGenes** signature (`model = "GenomeModels"`): Returns a data frame with gene names and their model scores sorted

**findModel** signature (`model = "ChromosomeArmModels"`): Finds a dependency model by gene name and returns it.

### Author(s)

Olli-Pekka Huovilainen

---

`fit.byname`*Fit dependency model around one gene between two data sets.*

---

**Description**

Takes a window from two datasets around chosen gene and fits a selected dependency model between windows.

**Usage**

```
fit.cgh.mir.byname(X, Y, geneName, windowSize, ...)
```

```
fit.cgh.mrna.byname(X, Y, geneName, windowSize, ...)
```

**Arguments**

<code>X, Y</code>	Data sets. Lists containing the following items: <ul style="list-style-type: none"><li><code>data</code> Data in a matrix form. Genes are in columns and samples in rows. e.g. gene copy number.</li><li><code>info</code> Data frame which contains following information about genes in data matrix.<ul style="list-style-type: none"><li><code>chr</code> Factor indicating the chromosome for the gene: (1 to 23, or X or Y)</li><li><code>arm</code> Factor indicating the chromosomal arm for the gene ('p' or 'q')</li><li><code>loc</code> Location of the gene in base pairs.</li></ul></li></ul> <p><a href="#">pint.data</a> can be used to create data sets in this format.</p>
<code>geneName</code>	The dependency model is calculated around this gene.
<code>windowSize</code>	Size of the data window.
<code>...</code>	Arguments to be passed to function <a href="#">fit.dependency.model</a>

**Details**

See [fit.dependency.model](#) for details about dependency models and parameters.

**Value**

[DependencyModel](#)

## See Also

Results from this function: [DependencyModel](#). `fit.dependency.model`. Calculating dependency models to chromosomal arm, chromosome or genome `screen.cgh.mrna`. For calculation of latent variable `z`: `link{z.expectation}`.

## Examples

```
data(chromosome17)

model <- fit.cgh.mrna.bynome(geneExp, geneCopyNum, "ENSG00000132361", 10)
## With different model parameters (pCCA)
model2 <- fit.cgh.mrna.bynome(geneExp, geneCopyNum, "ENSG00000132361", 10, zDimension=5, H=NA)
```

---

```
fit.dependency.model
```

*Fit dependency model between two data sets.*

---

## Description

Fits a selected dependency model between two data sets. The function can fit probabilistic canonical correlation analysis (pCCA; *Bach & Jordan 2005*), probabilistic principal component (pPCA; *Tipping & Bishop 1999*) analysis, probabilistic factorial analysis (pFA; *Rubin & Thayer 1982*) or similarity constrained canonical correlation analysis (pSimCCA; *Lahti et al. 2009*). These correspond to `ppca`, `pcca`, `pcca.isotropic` and `pfa` as well as different choices of the model structure and parameters in `fit.dependency.model`.

## Usage

```
fit.dependency.model(X, Y, zDimension = 1, marginalCovariances = "full",
H = 1, sigmas = 0, covLimit = 0, mySeed = 123)

ppca(X, Y, zDimension = 1)
pcca(X, Y, zDimension = 1)
pcca.isotropic(X, Y, zDimension = 1, covLimit = 1e-6)
pfa(X, Y = NULL, zDimension = 1)
```

**Arguments**

<code>X, Y</code>	The data sets. 'Variables x samples'. If NULL is given, model is calculated for only one data set.
<code>zDimension</code>	Dimensionality of the shared latent variable.
<code>marginalCovariances</code>	Type of marginal covariances. Options: "identical isotropic", "isotropic", "diagonal" and "full"
<code>H</code>	Mean of the matrix normal prior distribution for the transformation matrix T. Must be a matrix of size (variables in first data set) x (variables in second data set). If value is 1, H will be made identity matrix of appropriate size.
<code>sigmas</code>	Variance parameter for the matrix normal prior distribution of the transformation matrix T. Described the allowed deviation scale of the transformation matrix T from the mean matrix H.
<code>covLimit</code>	Convergence limit. default value depends on chosen model type.
<code>mySeed</code>	Random seed

**Details**

The dependency models considered in *Lahti et al. 2009* are obtained as follows:

**pPCA** `H = NA, marginalCovariances = "identical isotropic"` (*Tipping & Bishop 1999*)

**pFA** `H = NA, marginalCovariances = "diagonal"` (*Rubin & Thayer 1982*)

**pCCA** `H = NA, marginalCovariances = "full" or "isotropic"` (*Bach & Jordan 2005*)

**pSimCCA** `H = I, sigmas = 0, marginalCovariances = "full"`. This is the default method. (*Lahti et al. 2009*)

**pSimCCA with T prior** `H = I, marginalCovariances = "isotropic"` (*Lahti et al. 2009*)

Resulting [DependencyModel](#) object does not have location or z variable. Location can be set with `setLoc` method (see examples) and expectation of the latent variable z can be calculated with `link{z.expectation}`.

To avoid computational singularities, the covariance matrix phi is regularised by adding a small constant to the diagonal

**Value**

[DependencyModel](#)

model

# Contributions of samples and variables to model
plot(model, geneExp, geneCopyNum)
```

---

geneCopyNum

*Gene copy number data in chromosome 17*

---

## Description

Preprocessed gene copy number (aCGH) data for 51 patients in chromosome 17.

## Usage

```
data(chromosome17)
```

**Format**

A list which contain the following data:

**data** gene copy number data in matrix form. Genes are in columns and samples in rows

**info** Data frame which contains following information about genes in data matrix.

**chr** Factor indicating the chromosome for the gene (1 to 23, or X or Y)

**arm** Factor indicating the chromosomal arm for the gene ('p' or 'q')

**loc** Location of the gene in base pairs.

**Source**

Integrated gene copy number and expression microarray analysis of gastric cancer highlights potential target genes. Myllykangas et al., *International Journal of Cancer*, vol. **123**, no. **4**, pp. 817–25, 2008.

---

geneExp

*Gene expression data in chromosome 17*

---

**Description**

Preprocessed gene expression levels of 51 patients in chromosome 17.

**Usage**

```
data(chromosome17)
```

**Format**

A list which contain the following data:

**data** gene expression data in matrix form. Genes are in columns and samples in rows

**info** Data frame which contains following information about genes in data matrix.

**chr** Factor of chromosome where the gene is. (1 to 23 or X or Y)

**arm** Factor of arm of the chromosome arm where the gene is. ('p' or 'q')

**loc** Location of the gene from centromere in base pairs.

**Source**

Integrated gene copy number and expression microarray analysis of gastric cancer highlights potential target genes. Myllykangas et al., *International Journal of Cancer*, vol. **123**, no. **4**, pp. 817–25, 2008.

---

`pint.data`*Forms a data set and pairs samples in two data sets.*

---

### Description

Forms a data set for use in functions in 'pint' package (e.g. [screen.cgh.mrna](#)). Pairs samples in two data sets.

### Usage

```
pint.data(data, info)
pint.match(X, Y, max.dist)
```

### Arguments

<code>data</code>	Probe-level data in a matrix or data frame.
<code>info</code>	Location, chromosome, and chromosome arm. Information of the probes as data frame. Location can be given either as <code>loc</code> or <code>bp</code> , which is middle location of probe, or as <code>start</code> and <code>end</code> . Chromosome arm is given as <code>arm</code> and chromosome as <code>chr</code> .
<code>X, Y</code>	Data sets to be paired.
<code>max.dist</code>	maximum distance between paired genes in base pairs.

### Details

Function `pint.match` goes through every sample in `X` and finds the nearest sample in `Y` which is in the same chromosome arm. If more than one sample in `X` has same nearest sample in `Y`, all but one is discarded. Samples with longer distance than `max.dist` are discarded.

### Value

`pint.data` returns a list with a matrix with sample data and a data frame with `chr` (chromosome), `arm` (chromosome arm) and `loc` (location).

`pint.match` return a list with two data sets. These can be used in [screen.cgh.mrna](#) function.

### Author(s)

Olli-Pekka Huovilainen <ohuovila@gmail.com>

### See Also

[screen.cgh.mrna](#), [screen.cgh.mir](#), [fit.cgh.mir.byname](#)

### Examples

```
data(chromosome17)

newData <- pint.match(geneExp, geneCopyNum, max.dist=1000)
```

plot

*Dependency score plotting***Description**

Plot the contribution of the samples and variables to the dependency model or dependency model fitting scores of chromosomal arm, chromosome or genome.

**Usage**

```
plot.DependencyModel(x, X, Y, ann.types = NULL, ann.cols = NULL, legend.x = 0,
  legend.y = 1, legend.xjust = 0, legend.yjust = 1, order = FALSE,
  cex.z = 0.6, cex.WX = 0.6, cex.WY = 0.6, ...)
```

```
plot.ChromosomeArmModels(x, hilightGenes = NULL, showDensity = FALSE, showTop =
  topName = FALSE, type = 'l', xlab = 'gene location (Mbp)',
  ylab = 'dependency score', main = paste('Dependency score for chromosome ',
  chr, arm, sep = ''), pch = 20, cex = 0.75, tpch = 3, tcex = 1, ylim = NA, ...)
```

```
plot.ChromosomeModels(x, hilightGenes = NULL, showDensity = FALSE, showTop = 0,
  topName = FALSE, type = 'l', xlab = 'gene location (Mbp)', ylab = 'dependency score',
  main = paste('Dependency score for chromosome ', chr, sep = ''),
  pch = 20, cex = 0.75, tpch = 3, tcex = 1, xlim = NA, ylim = NA, ...)
```

```
plot.GenomeModels(x, hilightGenes = NULL, showDensity = FALSE, showTop = 0,
  topName = FALSE, onePlot = FALSE, type = 'l', ylab = "Dependency Scores",
  xlab = "Gene location (chromosome)", main = "Dependency Scores in All Chromosome",
  pch = 20, cex = 0.75, tpch = 20, tcex = 0.7, mfrow = c(5,5), mar = c(3,2.5,1.3,0),
  ps = 5, mgp = c(1.5,0.5,0),ylim=NA,...)
```

**Arguments**

<code>x</code>	<code>DependencyModel</code> -class, <code>ChromosomeArmModels</code> -class, <code>ChromosomeModels</code> -class, <code>GenomeModels</code> -class; models to be plotted.
<code>X, Y</code>	data sets used in dependency modeling.
<code>ann.types</code>	a factor for annotation types for samples. Each value corresponds one sample in datasets. Colors are used to indicate different types.
<code>ann.cols</code>	colors used to indicate different annotation types. Gray scale is used if 'NULL' given.
<code>legend.x, legend.y</code>	the x and y co-ordinates to be used to position the legend for annotation types.
<code>legend.xjust, legend.yjust</code>	how the legend is to be justified relative to the legend x and y location. A value of 0 means left or top justified, 0.5 means centered and 1 means right or bottom justified.
<code>order</code>	logical; if 'TRUE', values for sample contributions are ordered according to their values.
<code>cex.z, cex.WX, cex.WY</code>	Text size for variable names.

<code>highlightGenes</code>	vector of strings; Name of genes to be highlighted with dots.
<code>showDensity</code>	logical; if 'TRUE' small vertical lines are drawn in the bottom of the plot under each gene.
<code>showTop</code>	numeric; Number of models with highest dependencies to be highlighted. A horizontal dashed line is drawn to show threshold value. With 0 no line is drawn.
<code>topName</code>	logical; If TRUE, gene names are printed to highlighted models with highest dependencies. Otherwise highlighted models are numbered according to their rank in dependency score.
<code>type, xlab, ylab, main</code>	plot type and labels. See <a href="#">plot</a> for details. In <code>plot.GenomeModels</code> these affect only if <code>onePlot</code> is TRUE.
<code>onePlot</code>	If TRUE, all dependency scores are plotted in one plot window. Otherwise one plot window is used for each chromosome.
<code>pch, cex</code>	symbol type and size for <code>highlightGenes</code> . See <a href="#">points</a> for details.
<code>tpch, tcex</code>	symbol type and size for genes with highest scores. See <a href="#">points</a> for details.
<code>ylim, xlim</code>	axis limits. Default values are calculated from data. Lower limit for y is 0 and upper limit is either 1 or maximum score value. X limits are gene location range. See <a href="#">plot</a> for details.
<code>mfrow, mar, ps, mgp</code>	chromosome plots' layout, marginals, text size and margin line. See <a href="#">par</a> for details.
<code>...</code>	optional plotting parameters

## Details

Function plots scores of each dependency model of a gene for the whole chromosomal arm, chromosome or genome according to used method. `plot(x, cancerGenes = NULL, showDensity = FALSE, ...)` is also usable and chosen according to class of models.

```

---

calculate	<i>Fits dependency models to chromosomal arm, chromosome or the whole genome.</i>
-----------	---

---

## Description

Fits dependency models for whole chromosomal arm, chromosome or genome depending on arguments with chosen window size between two data sets.

## Usage

```
screen.cgh.mrna(X, Y, windowSize, chromosome, arm, method = "", params = list())
screen.cgh.mir(X, Y, windowSize, chromosome, arm, method = "", params = list())
```

## Arguments

X, Y	Data sets. Lists containing the following items: <i>data</i> Data in a matrix form. Genes are in columns and samples in rows. e.g. gene copy number. <i>info</i> Data frame which contains following information about genes in data matrix. <i>chr</i> Factor indicating the chromosome for the gene: (1 to 23, or X or Y) <i>arm</i> Factor indicating the chromosomal arm for the gene ('p' or 'q') <i>loc</i> Location of the gene in base pairs. <a href="#">pint.data</a> can be used to create data sets in this format.
chromosome	Specify the chromosome for model fitting. If missing, whole genome is screened.
arm	Specify chromosomal arm for model fitting. If missing, both arms are modeled.
windowSize	Determine the window size. This specifies the number of nearest genes to be included in the chromosomal window of the model, and therefore the scale of the investigated chromosomal region.
method	Specify the dependency model: <b>'pCCA'</b> probabilistic canonical correlation analysis <i>Bach &amp; Jordan 2005</i> <b>'pPCA'</b> probabilistic principal component analysis <i>Tipping &amp; Bishop 1999</i> <b>'pFA'</b> probabilistic factor analysis <i>Rubin &amp; Thayer 1982</i> <b>'pSimCCA'</b> probabilistic similarity constrained canonical correlation analysis <i>Lahti et al. 2009</i>

	<b>'TPriorpSimCCA'</b> probabilistic similarity constrained canonical correlation analysis with possibility to tune T prior (Lahti et al. 2009)
	If anything else, the model is specified by the given parameters.
params	List of parameters for the dependency model.
	<b>sigmas</b> Variance parameter for the matrix normal prior distribution of the transformation matrix T. This describes the deviation of T from H
	<b>H</b> Mean parameter for the matrix normal prior distribution prior of transformation matrix T
	<b>zDimension</b> Dimensionality of the latent variable
	<b>mySeed</b> Random seed.
	<b>covLimit</b> Convergence limit. Default depends on the selected method: 1e-3 for pSimCCA with full marginal covariances and 1e-6 for pSimCCA in other cases.

## Details

Function `screen.cgh.mrna` assumes that data is already paired. This can be done with `pint.match`. It takes sliding gene windows with `fixed.window` and fits dependency models to each window with `fit.dependency.model` function.

Function `screen.cgh.mir` calculates dependencies around a chromosomal window in each sample in X; only one sample from X will be used. Data sets do not have to be of the same size and X can be considerably smaller. This is used with e.g. miRNA data.

If method name is specified, this overrides the corresponding model parameters, corresponding to the modeling assumptions of the specified model. Otherwise method for dependency models is determined by parameters.

Dependency scores are plotted with `dependency score plotting`.

## Value

Depending on the arguments, returns a `ChromosomeArmModels` which contains all the models for dependencies in chromosomal arm, a `ChromosomeModels` which contains all the models for dependencies in chromosome or a `GenomeModels` which contains all the models for dependencies in genome.

### Examples

```
data(chromosome17)

## pSimCCA model on chromosome 17

models17pSimCCA <- screen.cgh.mrna(geneExp, geneCopyNum,
                                   windowSize = 10, chr = 17)

plot(models17pSimCCA)

## pCCA model on chromosome 17q with 3-dimensional latent variable z
models17ppCCA <- screen.cgh.mrna(geneExp, geneCopyNum,
                                 windowSize = 10,
                                 chromosome = 17, arm = 'p', method="pCCA",
                                 params = list(zDimension = 3))
plot(models17ppCCA)

## pFA on chromosome 17p. method is determined by the parameters
models17ppFA <- screen.cgh.mrna(geneExp, geneCopyNum,
                                windowSize = 10,
                                chromosome = 17, arm = 'p',
                                params = list(marginalCovariances = "diagonal", H = NA))

plot(models17ppFA)
```

---

window

*Form data with a selected window size for the model fitting*

---

### Description

Forms a chosen window of two data matrices to use for `fit.dependency.model` either iteratively picking nearest genes or picking same number of genes from both directions. `sparse.window` forms a window around one sample in the first data set with a number of samples from the second data set.

### Usage

```
fixed.window(X, Y, middleIndex, windowSize)
iterative.window(X, Y, middleIndex, windowSize)
sparse.window(X, Y, xIndex, windowSize)
```

**Arguments**

X	First data set. In <code>sparse.window</code> windows will be formed around each sample in this data set.
Y	Second data set.
middleIndex	Index of middle position for window.
xIndex	Index of middle position in X for window.
windowSize	Number of genes in window. In <code>sparse.window</code> X has always one sample in window.

**Details**

Window contains `windowSize` nearest genes. Warning is given if `windowSize` genes is not found in the same chromosomal arm. Data of both data sets is normalised so that each genes data has zero mean.

**Value**

List of window data:

X	window of the first data set
Y	window of the second data set
loc	location of gene
geneName	name of the gene
edge	logical; TRUE if iteration to one direction has stopped because edge of data in chromosomal arm has been found.
fail	logical; TRUE if chromosomal arm contains less than <code>windowSize</code> genes.

**Author(s)**

Olli-Pekka Huovilainen <ohuovila@gmail.com>

**See Also**

Dependency model fitting: [fit.dependency.model](#)

**Examples**

```
data(chromosome17)
window <- iterative.window(geneExp, geneCopyNum, 30, 10)
model <- fit.dependency.model(window$X, window$Y)
setGeneName(model) <- window$geneName
setLoc(model) <- window$loc
model

window <- fixed.window(geneExp, geneCopyNum, 10, 10)
model <- fit.dependency.model(window$X, window$Y, H = NA)
model
```

---

z.expectation	<i>The model parameters z and W</i>
---------------	-------------------------------------

---

## Description

Expectation of the latent variable  $z$ , contribution of each sample to a dependency model, and contribution of each variable.

## Usage

```
z.expectation(model, X, Y = NULL)
z.effects(model, X, Y = NULL)
W.effects(model, X, Y = NULL)
```

## Arguments

model	The fitted dependency model.
X, Y	Data sets used in fitting the dependency modeling functions ( <code>screen.cgh.mrna</code> or <code>link{fit.dependency.model}</code> ). Note: Arguments must be given in the same order as in <code>fit.dependency.model</code> or <code>screen.cgh.mrna</code> . Only X is needed for dependency model for one data set.

## Details

`z.expectation` gives ML estimate of the shared latent variable  $Z$ , given data  $X$ ,  $Y$  and the model parameters in `model`.

`z.effects` gives the contribution of each sample to the dependency score. This is approximated by projecting original data to first principal component of  $\bar{W}z$ .

`W.effects` gives the contribution of each variable to the observed dependency. This is approximated with the loadings of the first principal component of  $\bar{W}z$

Original data can be retrieved by locating the row in  $X$  (or  $Y$ ) which has the same variable (gene) name than `model`.

## Value

`z.expectation` gives the matrix  $z$ . `z.effects` gives a projection vector over the samples and `W.effects` gives a projection vector over the variables.
