

Package ‘CTDquerier’

May 30, 2019

Title Package for CTDbase data query, visualization and downstream analysis

Version 1.5.0

Maintainer Carles Hernandez-Ferrer <carles.hernandez@isglobal.org>

Description Package to retrieve and visualize data from the Comparative Toxicogenomics Database (<http://ctdbase.org/>). The downloaded data is formatted as DataFrames for further downstream analyses.

Depends R (>= 3.4.0)

License MIT + file LICENSE

Encoding UTF-8

LazyData true

Imports RCurl, stringr, S4Vectors, stringdist, ggplot2, igraph, utils, grid, gridExtra, methods, stats, BiocFileCache, rappdirs

VignetteBuilder knitr

Suggests BiocStyle, knitr

RoxygenNote 6.0.1

biocViews Software, BiomedicalInformatics, Infrastructure, DataImport, DataRepresentation, GeneSetEnrichment, NetworkEnrichment, Pathways, Network, GO, KEGG

git_url <https://git.bioconductor.org/packages/CTDquerier>

git_branch master

git_last_commit 1281ccd

git_last_commit_date 2019-05-02

Date/Publication 2019-05-29

CTDdata	<i>Class CTDdata</i>
---------	----------------------

Description

Class resulting of [query_ctd_gene](#), [query_ctd_chem](#) and [query_ctd_dise](#). It is used to encapsulate all the information in *CTDbase* for given set of genes, chemicals or diseases.

Usage

```
## S4 method for signature 'CTDdata'
enrich(x, y, universe, use = "curated", warnings = TRUE,
      ...)

## S4 method for signature 'CTDdata'
get_table(object, index_name, ...)

## S4 method for signature 'CTDdata'
get_terms(object)

## S4 method for signature 'CTDdata,ANY'
plot(x, y, index_name = "base",
     representation = "heatmap", ...)
```

Arguments

x	Object of class CTDdata.
y	NOT USED
universe	String vector of genes used as universe. If not provided, all genes in CTDbase are used.
use	Select if all or only curated relations are used.
warnings	Shows or hiddes warnings.
...	NOT USED
object	Object of class CTDdata.

index_name Name of the plot to be draw. "base" shows a bar-plot indicating the number of terms lost&found at CTDbase. For *gene* queries index_name can take values "disease", "chemical", "gene-gene interaction", "kegg pathways" and "go terms". The first two have only "heatmap" representation, the last to have only "network" representation, and "gene-gene interaction" has both. For *chemical* queries index_name can take values "gene", "disease", "kegg pathways" and "go terms". The first has both "heatmap" and "network" representation, while the last only "network". The otehr three have only "heatmap" representation. For *disease* queries index_name can take values "gene", "chemical" and "kegg pathways". The first two have "heatmap" representation while the last "network" representation.

representation Can take values "heatmap" or "network".

Value

An object of class CTDdata

Methods (by generic)

- **enrich**: Method to perform enrichment analysis given two object of class CTDdata.
- **get_table**: Method to obtain a specific inner table from an CTDdata object.
- **get_terms**: Return a list with the terms found to create the object.
- **plot**: Generates a basic plot showing the number of terms that can be used to query CTDbase.

Slots

type Character saving "GENE", "CHEMICAL" or "DISEASE" depending if it was created using [query_ctd_gene](#), [query_ctd_chem](#) or [query_ctd_dise](#)

terms DataFrame with the genes, chemicals or diseases used to create the object.

losts Character with the terms used to create the object but that were nor present in CTDbase.

gene_interactions (Only for chemicals) Table with a relation of the genes interacting with the given chemicals.

chemicals_interactions (Only for genes) Table with a relation of the chemicals interacting with the given genes.

diseases Table with a relation of the diseases associated with given genes or chemicals.

gene_gene_interactions (Only for genes) Table with a relation of the genes interacting with the given genes.

kegg Table with a relation of the KEGG pathways affected by the given chemicals or where the given genes play a role.

go Table with a relatio of the GO terms afected by the given chemicals or where the given genes play a role.

See Also

[query_ctd_gene](#) to create a CTDdata from a set of genes, [query_ctd_chem](#) to create a CTDdata from a set of chemicals, [query_ctd_dise](#) to create a CTDdata from a set of diseases, [get_table](#) to retrieve encapsulated data and [plot](#) to get nice plots from stored data.

CTDquerier	<i>Package for CTDBase data query, data visualization and data analysis.</i>
------------	--

Description

Package for CTDBase data query, data visualization and data analysis.

Data Download

CTDquerier offers two functions to query CTDBase (<http://ctdbase.org>): [query_ctd_gene](#) to query CTDBase given a set of genes; and [query_ctd_chem](#) to query CTDBase given a set of chemicals. Both functions returns [CTDdata](#) objects. Raw downloaded information can be retrieved from [CTDdata](#) using method [get_table](#).

Data Visualization

[CTDdata](#) objects offers basic visualization of the downloaded information using standard plot method.

download_ctd_chem	<i>Function to download chemicals available in CTDBase</i>
-------------------	--

Description

This function download the "Chemical vocabulary" file (`CTD_chemicals.tsv.gz`) from <http://ctdbase.org/download>

Usage

```
download_ctd_chem(filename = "CTD_chemicals.tsv.gz", mode = "auto",
  verbose = FALSE)
```

Arguments

filename	(default "CTD_chemicals.tsv.gz") Name of the file in the local system.
mode	(default "auto") Mode passed to download.file.
verbose	(default FALSE) If set to TRUE is shows relevant information of each step.

Details

The field included in the file (`CTD_chemicals.tsv.gz`) are:

1. ChemicalName
2. ChemicalID (MeSH identifier)
3. CasRN (CAS Registry Number, if available)
4. Definition
5. ParentIDs (identifiers of the parent terms; '|'-delimited list),
6. TreeNumbers (identifiers of the chemical's nodes; '|'-delimited list),
7. ParentTreeNumbers (identifiers of the parent nodes; '|'-delimited list),
8. Synonyms ('|'-delimited list)
9. DrugBankIDs ('|'-delimited list)

Value

Passed name into filename argument if it could be download 1 otherwise.

Examples

```
download_ctd_chem()  
file.exists( "CTD_chemicals.tsv.gz" )
```

download_ctd_dise *Function to download diseases available in CTDbase*

Description

This function download the "Disease vocabulary" file (CTD_diseases.tsv.gz) from <http://ctdbase.org/downloads>.

Usage

```
download_ctd_dise(filename = "CTD_diseases.tsv.gz", mode = "auto",  
                  verbose = FALSE)
```

Arguments

filename	(default "CTD_diseases.tsv.gz") Name of the file in the local system.
mode	(default "auto") Mode passed to download.file.
verbose	(default FALSE) If set to TRUE is shows relevant information of each step.

Details

The field included in the file (CTD_diseases.tsv.gz) are:

1. DiseaseName
2. DiseaseID (MeSH or OMIM identifier)
3. Definition
4. AltDiseaseIDs (alternative identifiers; '|'-delimited list)
5. ParentIDs (identifiers of the parent terms; '|'-delimited list)
6. TreeNumbers (identifiers of the disease's nodes; '|'-delimited list)
7. ParentTreeNumbers (identifiers of the parent nodes; '|'-delimited list)
8. Synonyms ('|'-delimited list)
9. SlimMappings (MEDIC-Slim mappings; '|'-delimited list)

Value

Passed name into filename argument if it could be download 1 otherwise. download_ctd_dise()
file.exists("CTD_diseases.tsv.gz")

`download_ctd_genes` *Function to download genes available in CTDbase*

Description

This function download the "Gene vocabulary" file (`CTD_genes.tsv.gz`) from <http://ctdbase.org/downloads>.

Usage

```
download_ctd_genes(verbose = FALSE)
```

Arguments

`verbose` (default FALSE) If set to TRUE is shows relevant information of each step.

Details

The field included in the file (`CTD_genes.tsv.gz`) are:

1. GeneSymbol
2. GeneName
3. GeneID (NCBI Gene identifier)
4. AltGeneIDs (alternative NCBI Gene identifiers; '|' -delimited list)
5. Synonyms ('|' -delimited list)
6. BioGRIDIDs ('|' -delimited list)
7. PharmGKBIDs ('|' -delimited list)
8. UniprotIDs ('|' -delimited list)

Value

Passed name into `filename` argument if it could be download 1 otherwise.

Examples

```
download_ctd_genes()
```

`enrich` *Method to perform enrichment analysis using two CTDData objects*

Description

This methods performs a fisher test using the genes in two objects of class `CTDData`. The object in 'x' is used as source while the object on 'y' is used as universe. When object 'x' corresponds to an object created with `query_ctd_gene`, the used genes are the found terms in CTDbase. In the other cases (chemicals and disease `CTDData`), the genes from the 'gene interactions' table are used. If universe is missing, all genes in CTDbase are used as universe.

Usage

```
enrich(x, y, universe, use = "curated", warnings = TRUE, ...)
```

Arguments

x	Object of class <code>CTDdata</code> .
y	Object of class <code>CTDdata</code> .
universe	Vector of strings corresponding to the genes to be used as universe.
use	(default: "curated") It can take values "curated" or "all" to filter or not filter for curated the genes into the <code>CTDdata</code> objects.
warnings	(default: TRUE).
...	NOT USED

Value

A list with class `htest`. Check `fisher.test` for more information.

gala

CTDdata for illustrative purposes

Description

`CTDdata` with information of 258 genes downloaded from `CTDbase`. The object was created from from the genes obtained from the scientific article entitled "Case-control admixture mapping in Latino populations enriches for known asthma-associated genes" (Table E1) by Torgerson et. al. The genes were used to query `CTDbase` using `query_ctd_genes` function.

Usage

```
data("gala")
```

Format

An object of class `CTDdata` of length 1.

Value

An `CTDdata` object.

Examples

```
data("gala")
gala
```

get_table	<i>Method to obtain a specific inner table from a CTDDdata object.</i>
-----------	--

Description

Obtain the raw data from a CTDDdata object, result from a query to CTDBase.

Usage

```
get_table(object, index_name, ...)
```

Arguments

object	Object of class CTDDdata.
index_name	String indicating the type of data to obtain.
...	NOT USED

Details

Available tables are (index_name):

1. "gene interactions": (Only for chemicals) Table with a relation of the genes interacting with the given chemicals.
2. "chemical interactions": (Only for genes) Table with a relation of the chemicals interacting with the given genes.
3. "diseases": Table with a relation of the diseases associated with given genes or chemicals.
4. "gene-gene interactions": (Only for genes) Table with a relation of the genes interacting with the given genes.
5. "kegg pathways": Table with a relation of the KEGG pathways affected by the given chemicals or where the given genes play a role.
6. "go terms": Table with a relation of the GO terms affected by the given chemicals or where the given genes play a role.

Value

A DataFrame containing the raw result from CTDDdata.

Examples

```
data("gala")  
get_table(gala, "diseases")[1:3, ]
```

get_terms	<i>Getter to obtain the terms used to perform a query into CTDBase</i>
-----------	--

Description

Getter to obtain the terms used to perform a query into CTDBase

Usage

```
get_terms(object)
```

Arguments

object Object of class `CTDdata`.

Value

A list with two accessors: "used" for the terms that exist in CTDBase, and "lost" with the terms that do not exist in CTDBase.

Examples

```
data("gala")
get_terms(gala)[["lost"]]
```

leaf_plot	<i>Function to create a leaf plot</i>
-----------	---------------------------------------

Description

This function takes a `data.frame` and returns a `gtable` with three plots. The left-leafes, the axis names and the right-leafes.

Usage

```
leaf_plot(dta, label = "name", valueLeft = "var1", valueRight = "var2",
  titleLeft = NULL, titleRight = NULL, colorLeft = "#FF7F50",
  colorRight = "#20B2AA")
```

Arguments

dta	<code>data.frame</code> with, at last, three columns corresponding to the axis labels, the left values and the right values.
label	(default "name") Name of the column in <code>dta</code> with the labels.
valueLeft	(default "var1") Name of the column with the values for the left plot.
valueRight	(default "var2") Name of the column with the values for the right plot.
titleLeft	(default NULL) Character used as a title for the left plot.
titleRight	(default NULL) Character used as a title for the right plot.
colorLeft	(default "#FF7F50") Color for left plot bars.
colorRight	(default "#20B2AA") Color for right plot bars.

Value

A ggplot2 object.

Examples

```
data <- data.frame(
  labels = LETTERS[1:15],
  right = runif(n = 15) * 11,
  left = runif(n = 15) * 9
)
leaf_plot( data, "labels", "left", "right", "runif09", "runif11")
```

load_ctd_chem

Function to load the .tsv.gz file for chemicals

Description

Function to load the .tsv.gz file for chemicals

Usage

```
load_ctd_chem(filename = "CTD_chemicals.tsv.gz")
```

Arguments

filename (default "CTD_chemicals.tsv.gz") File with the chemicals downloaded from CT-
Dbase.

Details

The field included in the file (CTD_chemicals.tsv.gz) are:

1. ChemicalName
2. ChemicalID (MeSH identifier)
3. CasRN (CAS Registry Number, if available)
4. Definition
5. ParentIDs (identifiers of the parent terms; '|'-delimited list),
6. TreeNumbers (identifiers of the chemical's nodes; '|'-delimited list),
7. ParentTreeNumbers (identifiers of the parent nodes; '|'-delimited list),
8. Synonyms ('|'-delimited list)
9. DrugBankIDs ('|'-delimited list)

Value

A data.frame with the content of the file "CTD_genes.tsv.gz"

Examples

```
download_ctd_chem()
fd1 <- load_ctd_chem()
dim( fd1 )
```

load_ctd_dise	<i>Function to load the .tsv.gz file for disease</i>
---------------	--

Description

Function to load the .tsv.gz file for disease

Usage

```
load_ctd_dise(filename = "CTD_diseases.tsv.gz")
```

Arguments

filename (default "CTD_diseases.tsv.gz") File with the chemicals downloaded from CT-
Dbase.

Details

The field included in the file (CTD_diseases.tsv.gz) are:

1. DiseaseName
2. DiseaseID (MeSH or OMIM identifier)
3. Definition
4. AltDiseaseIDs (alternative identifiers; '|'-delimited list)
5. ParentIDs (identifiers of the parent terms; '|'-delimited list)
6. TreeNumbers (identifiers of the disease's nodes; '|'-delimited list)
7. ParentTreeNumbers (identifiers of the parent nodes; '|'-delimited list)
8. Synonyms ('|'-delimited list)
9. SlimMappings (MEDIC-Slim mappings; '|'-delimited list)

Value

A data.frame with the content of the file "CTD_genes.tsv.gz"

Examples

```
download_ctd_dise()  
fdl <- load_ctd_dise()  
dim( fdl )
```

load_ctd_gene	<i>Function to load the .tsv.gz file for genes</i>
---------------	--

Description

This function works in pair with [download_ctd_genes](#). This function loads into the R session the downloaded "CTD_genes.tsv.gz" file.

Usage

```
load_ctd_gene()
```

Details

The field included in the file (CTD_genes.tsv.gz) are:

1. GeneSymbol
2. GeneName
3. GeneID (NCBI Gene identifier)
4. AltGeneIDs (alternative NCBI Gene identifiers; '|'-delimited list)
5. Synonyms ('|'-delimited list)
6. BioGRIDIDs ('|'-delimited list)
7. PharmGKBIDs ('|'-delimited list)
8. UniprotIDs ('|'-delimited list)

Value

A data.frame with the content of the file "CTD_genes.tsv.gz"

Examples

```
download_ctd_genes()
fd1 <- load_ctd_gene()
dim( fd1 )
```

query_ctd_chem	<i>Function to query CTDbase using chemical terminology (Chemical Name)</i>
----------------	---

Description

This function checks for CTDbase gene vocabulary and query CTDbase for each one, downloading chemical-genes interactions, associated diseases, associated KEGG pathways and associated GO terms.

Usage

```
query_ctd_chem(terms, filename = "CTD_chemicals.tsv.gz", mode = "auto",
  max.distance = 10, verbose = FALSE)
```

Arguments

terms	Character vector with the chemicals used in the query.
filename	(default "CTD_chemicals.tsv.gz") Name of the file to store the CTDBase chemicals vocabulary.
mode	(default "auto") Mode passed to download.file.
max.distance	(default 10) Maximum distance allowed between a given element in terms argument and a possible match in CTDBase.
verbose	(default FALSE) If set to TRUE is shows relevant information of each step.

Value

An object of class [CTDdata](#).

Examples

```
rst <- query_ctd_chem( terms = c( "Iron", "Air Pollutants" ), verbose = TRUE )
```

query_ctd_dise	<i>Function to query CTDBase using disease terminology</i>
----------------	--

Description

This function cheks for CTDBase disease vocabulary and query CTDBase for each one, downloading disease-gene interactions, chemicals interactions, associated desease, associated KEGG pathways and associated GO terms.

Usage

```
query_ctd_dise(terms, filename = "CTD_diseases.tsv.gz", mode = "auto",
  verbose = FALSE)
```

Arguments

terms	Character vector with the diseases used in the query.
filename	(default "CTD_diseases.tsv.gz") Name of the file to store the CTDBase disease vocabulary.
mode	(default "auto") Mode passed to download.file.
verbose	(default FALSE) If set to TRUE is shows relevant information of each step.

Value

An object of class [CTDdata](#).

Examples

```
rst <- query_ctd_dise( terms = "Asthma", verbose = TRUE )
```

query_ctd_gene	<i>Function to query CTDBase using gene terminology (Gene Symbol)</i>
----------------	---

Description

This function checks for CTDBase gene vocabulary and query CTDBase for each one, downloading gene-gene interactions, chemicals interactions, associated disease, associated KEGG pathways and associated GO terms.

Usage

```
query_ctd_gene(terms, verbose = FALSE)
```

Arguments

terms	Character vector with the genes used in the query.
verbose	(default FALSE) If set to TRUE is shows relevant information of each step.

Value

An object of class [CTDdata](#).

Examples

```
rst <- query_ctd_gene( terms = c( "APP", "HMOX1A", "hmox1" ), verbose = TRUE )
```
